Abstract

The oral cavity has one of the most complex microbial properties in the body. Streptococci are the most important organisms in the mouth. Today, due to the resistance of the bacteria and the ability of bacteria to cause acute infections, the use of medicinal herbs and effective natural products has become widespread. Therefore, in this study, we tried to report medicinal herbs that have anti-*Streptococcus viridans* properties. In the current review, the articles were searched with keywords of *Streptococcus viridians*, dental diseases, herbs and phytotherapy. Searching was carried out for databases including Scopus, ISCs, SIDs, Magnets, and a number of other databases. Based on the results of the review, it was revealed that the herbs including Schinus terebinthifolius, Rosmarinus officinalis, Hyptis pectinata, Wilbrandia sp, Amaryllis belladonna, Lafoensia pacari, Hematanthus phagedaenicus, Achyrocline satureioides, Dorstenia sp, Boerhaavia coccinea and Copaifera sp are the most important medicinal plants with anti-*Streptococcus viridans* effect. The medicinal plants have the anti-*Streptococcus viridans* effects due to the bioactive substances, antioxidants, flavonoids, flavones, anthocyanins, etc.

Keywords: Oral Infections, *Streptococcus viridans*, Medicinal Plants

INTRODUCTION

Oral infections are one of the most common causes of human health threats, which are the main causes of the generation and distribution of various microorganisms that naturally live in the mouth. The oral cavity has one of the most complex microbial properties in the body. Streptococci are the most important organisms in the mouth (1). *Streptococci viridians* are a nonlinear classification comprising a large group of alphasic hemolytic Streptococci in oral cavity. *Streptococci viridians* do not have Lancefield Group antigens. They have little pathogenicity (2). Oral and dental infections and the prevention of systemic diseases such as infective endocarditis require the use of a variety of antibiotics (3.4). Selection of an appropriate antibiotic in hospitals in addition to the optimal treatment of the disease, can also reduce the complications of the disease, reduce the duration of the disease, reduce the cost of treatment, and reduce the types of resistant bacteria that can be treated, and can also complicate antibiotics (5- 7). Controlling the amount of decay microorganisms reduces tooth decay (8). Despite the fact that many antimicrobial agents are effective in controlling and removing dental plaque, but due to the problems with the procedure and the various factors within the mouth, few of them demonstrate the clinical effects, or some of them cause many side effects in long-term usage (9). Today, due to the drug resistance and the ability of the bacteria to cause acute infections, the use of medicinal herbs and effective natural products has become widespread (13-13). Medicinal plants are used due to the richness in medicinal and antioxidant substances with special effects (22-42) and in the treatment of various diseases (23-26). In this study, we tried to report medicinal herbs that have anti-*Streptococcus viridans* effects.

METHODS

In the current review, the articles were searched with words of *Streptococcus viridans*, dental diseases, herbs and phytotherapy. Searching was carried out from databases including Scopus, ISCs, SIDs, Magnets, and a number of other databases.

RESULTS

Accordingly, 11 effective herbal medicines on *Streptococci viridians* are used. Based on the results of the review, it was revealed that the herbs of Schinus terebinthifolius, Rosmarinus officinalis, Hyptis pectinata, Wilbrandia sp, Amaryllis belladonna, Lafoensia pacari, Hematanthus phagedaenicus, Achyrocline satureioides, Dorstenia sp, Boerhaavia coccinea and Copaifera sp are the most important medicinal plants with anti-*Streptococcus viridans* effect. Further details are given in Table 1.

DISCUSSION

Oral hygiene is one of the most important aspects of everyday life, which, if not done properly, causes gingivitis and severe tooth pain. Dental infections are sometimes so dangerous that they will be at the expense of human lives if they do not pay attention. Several factors such as inappropriate health and misuse of oral and dental washing, inappropriate food selection, inheritance and lack of medical and specialized oral and dental care can contribute to the development of tooth plaque (29). Maintaining proper oral and dental health is the only way to prevent tooth decay and damage caused by it. One of the easy ways to maintain oral hygiene is the use of medicinal herbs. Traditionally, vegetables, fruits include apple, hawthorn, celery, strawberries, walnut shells, etc., to remove dental plaque and tooth decay infectious agents (30,31). Medicinal plants are rich in active and bioactive and antioxidant substances that have therapeutic properties. Medicinal plants have antimicrobial effects on dental agents and dental plaque due to their active compounds (32-38). Medicinal plants have the of anti-Streptococcus viridans effects due to the bioactive substances, antioxidants, flavonoids, flavones, anthocyanins, etc.
